

# Preface

Thank you for purchasing the Basic and Smart solar series drive developed and produced by Himel

The Basic series drive is a universal high-performance drive with advanced control performance such as large low-frequency torque, self-identification of motor parameters, and optimal acceleration and deceleration control; it has functions to meet different process requirements, such as multi-step control and simple PLC control , PI control, fixed-length control, droop control, automatic energy-saving operation, flexible frequency setting method, diversified frequency combination methods and combination algorithms, and other practical functions. It can be used to drive machine tools, cables, textiles, papermaking, food, packaging, chemicals, municipal engineering and other automated production equipment to meet the performance and function requirements of different industrial equipment.

Before using this drive, the users and relevant technicians shall read this manual carefully to ensure that the drive can be properly installed and operated, so that the drive can perform its best performance.

If there is any change to this user manual, please refer to the new version without notice.

## High-performance Drive User Manual

Version: V1.1

## **This product implements standards:**

The design and production of this product refer to the latest national standards (GB or GB/T), International Electrotechnical Commission Standards (IEC) and International System of Units (SI). The technical parameters of the relevant parts can meet the requirements of national standards (GB or GB/T) and International Electrotechnical Commission Standards (IEC). Main standards:

GB/T 12668.2-2002 Adjustable Speed Electrical Power Drive Systems - Part 2: General Requirements - Rating Specifications for Low Voltage Adjustable Frequency AC Power Drive Systems

GB 12668.3-2012 Adjustable Speed Electrical Power Drive Systems - Part 3: EMC Requirements and Specific Test Methods

GB 12668.501-2013 Adjustable Speed Electrical Power Drive Systems - Part 5: Safety Requirements - Electrical, Thermal and Energy

GB/T 2423.1-2008 Environmental Testing for Electric and Electronic Products - Part 1: Test Methods Tests A: Cold

GB/T 2423.2-2008 Environmental Testing for Electric and Electronic Products - Part 2: Test Methods Tests B: Dry Heat

GB/T 2423.3-2016 Environmental Testing - Part 2: Testing Method - Test Cab: Damp Test, Steady State

GB/T 2423.4-2008 Environmental Testing for Electric and Electronic Products - Part 2: Test method - Test Db: Damp heat, cyclic (12h+12h Cycle)

GB/T 2423.22-2012 Environmental Testing - Part 2: Test Methods - Test N: Change of Temperature

GB/T 2423.7-2018 Environmental Testing - Part 2: Test Methods - Test Ec: Rough Handling Shocks, Primarily for Equipment-type Specimens

GB/T4798.1-2005 Environmental Conditions Existing in the Application of Electric and Electronic Products Section 1: Storage

GB/T4798.2-2008 Environmental Conditions Existing in the Application of Electric and Electronic Products - Part 2: Transportation

GB/T4798.3-2007 Environmental Conditions Existing in the Application of Electric and Electronic Products - Part 3: Stationary Use at Weather-protected Locations

# Danger

The drive must be reliably grounded. If the drive is not reliably grounded, there may be a potential danger of personal injury in the device.

## Readers

This user manual is suitable for the following readers.

Drive installers, engineering technicians (electrical engineers, electrical operators, etc.), designers, etc. Please ensure that this user manual reaches the end users.

## Notational conventions in this manual

**Caution:** Moderate or minor injuries may occur due to failure to operate as required.

**Danger:** Deaths or serious injuries may occur due to failure to operate as required.

# Chapter I Product Specification and Ordering Instructions

## 1.1 Drive series models

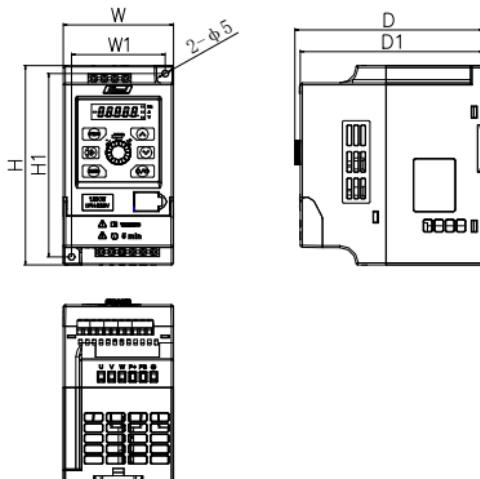

This drive has two voltage levels of 220V and 380V. The applicable motor power range is: 380V: 0.4kW-5.5kW; 220V: 0.4kW-2.2kW. The models of this series drives are shown in Table 1-1.

Table 1-1 Drive Models

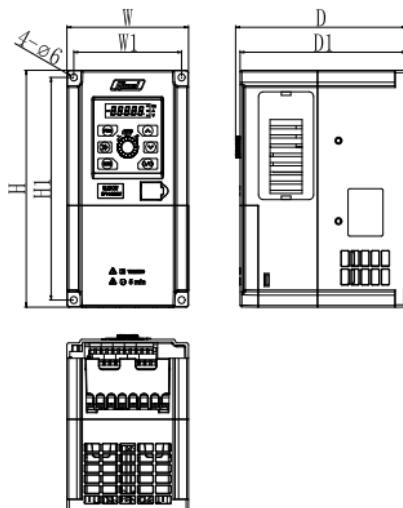

Drive model (G: Constant torque load)	Rated capacity (kVA)	Rated output current (A)	Adaptable motor (kW)
220V single phase	HAV-BA/SS-2S0004G	0.75	2.4
	HAV-BA/SS-2S0007G	1.5	4.5
	HAV-BA/SS-2S0015G	2.7	7.1
	HAV-BA/SS-2S0022G	3.7	9.8
220V three-phase	HAV-BA/SS-2T0022G	3.7	9.8
380V three-phase	HAV-BA/SS-4T0004G	0.75	1.5
	HAV-BA/SS-4T0007G	1.5	2.3
	HAV-BA/SS-4T0015G	2.7	3.7
	HAV-BA/SS-4T0022G	3.7	5.0
	HAV-BA/SS-4T0040G	7.5	8.8
	HAV-BA/SS-4T0055G	9.0	13.0
			5.5

 **Note:** For other power stage models of 220V voltage level, please consult the manufacturer before ordering.

## 1.2 Product appearance and installation dimensions

## 1.4 Braking resistors

Please select energy consumption braking resistors according to Table 1-5 and Table 1-6. The wiring of the braking resistors is shown in Figure 1-4.

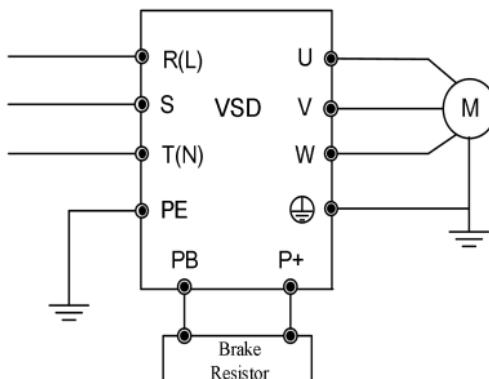

Figure 1-4 Drive and Braking Resistor Connection Diagram

- Note:**
1. The power derating of the braking resistor shall not exceed 30%, otherwise there is a risk of fire;
  2. The length of the wire for braking resistor shall be less than 5m.

During the braking process, the braking resistor will cause

temperature rise due to energy consumption. During installation, pay attention to safety protection and sound ventilation.

The braking resistor resistance and the power are selected according to the actual situation. The greater the system inertia, the shorter the deceleration time required, the more frequent the braking, the greater the power required by the braking resistor and the smaller the resistance required. Table 1-5 and Table 1-6 are recommended based on general applications (braking usage rate is 10%).

Table 1-5 Braking Resistor Selection Table (380V Voltage Level)

Specification	Suitable motor power (kW)	Braking resistor recommended Resistance ( $\Omega$ )	Braking resistor recommended Power (W)
HAV-BA/SS-4T0004G	0.4	$\geq 750$	75
HAV-BA/SS-4T0007G	0.75	$\geq 500$	100
HAV-BA/SS-4T0015G	1.5	$\geq 300$	200
HAV-BA/SS-4T0022G	2.2	$\geq 200$	200
HAV-BA/SS-4T0040G	4.0	$\geq 200$	300

# Chapter II Installation and Wiring of Drive

## 2.1 Drive installation environment

### 2.1.1 Installation environment requirements

- (1) Install in a well-ventilated indoor place. The ambient temperature is required to be within the range of -10°C-40°C. If the temperature exceeds 40°C, external forced cooling or derating is required.
- (2) Avoid installing in places with direct sunlight, dusty, floating fibers and metal powder.
- (3) Do not install in places with corrosive or explosive gases.
- (4) The humidity is required to be lower than 90%RH, without condensation of water droplets.
- (5) Install in places where the plane fixed vibration is less than 5.9 m/s<sup>2</sup>.
- (6) Try to keep away from electromagnetic interference sources and other electronic instruments and equipment that are sensitive to electromagnetic interference.

### 2.1.2 Installation direction and space

- (1) Generally, vertical installation shall be adopted.
- (2) Minimum installation gaps and distances are shown in Figure 2-1.
- (3) When multiple drives are installed up and down, the BA/SSffle applied in the middle is shown in Figure 2-2.

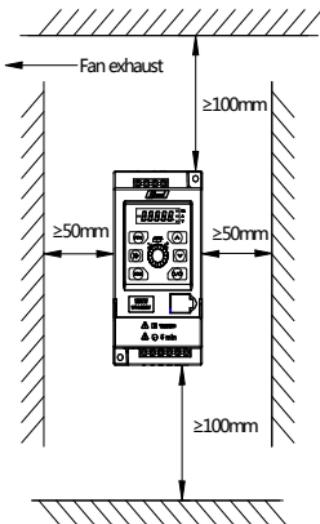

Figure 2-1 Installation Gap Diagram

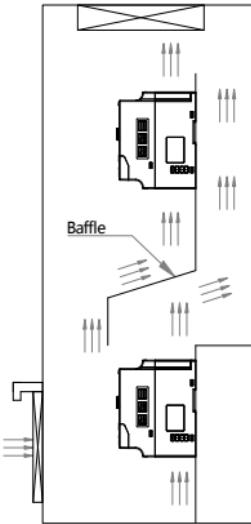

Figure 2-2 Installation Diagram of Multiple Drives

### 2.1.3 Mechanical installation methods and steps(wall-mounted installation and guide rail installation are supported)

#### 1. Wall-mounted screw installation

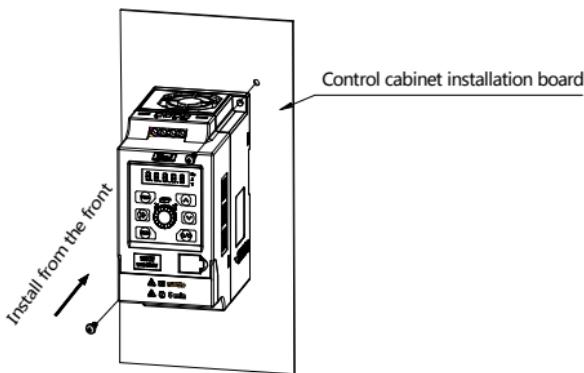

Figure 2-3 Wall-mounted Installation Diagram

#### 2. Guide rail installation

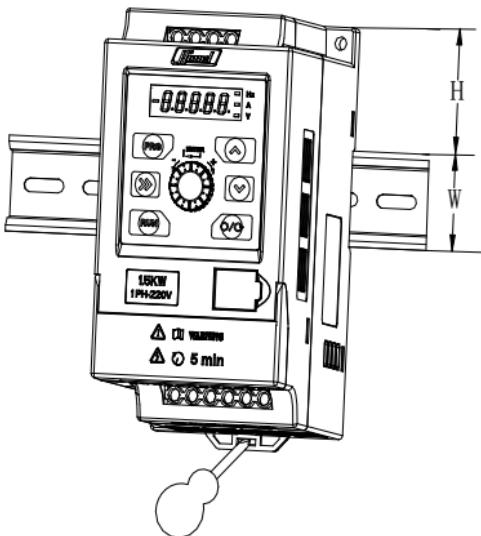

Figure 2-4 Guide Rail Installation Diagram

- (1) Use a slotted screwdriver to insert into the slide block groove at the bottom, to move the slide block out;
- (2) Install the machine onto the guide rail support, push the guide rail slide block up to the original place and clamp.

**Note: H is 45mm, W is 35mm**

Table 2-1 Guide Rail Installation Table

Specification	Whether supported
HAV-BA/SS-4T0004G	Supported
HAV-BA/SS-2S0004G	
HAV-BA/SS-4T0007G	
HAV-BA/SS-2S0007G

## 2.2. Removal and installation of keypad

### 1. RJ45 flip shell

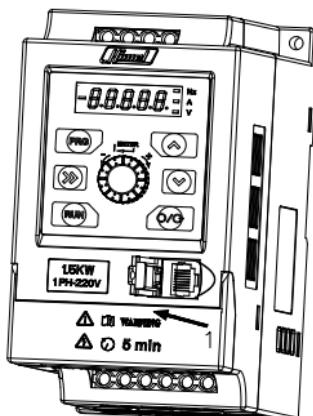

Figure 2-5 RJ45 Flip Shell's Open-Connect External Keypad

## 2. Wiring flip shell

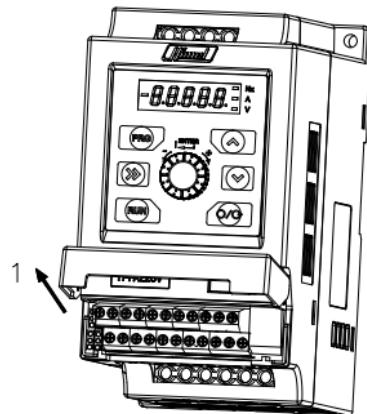

Figure 2-6 Wiring Flip Shell's Open-Control Terminal Wiring

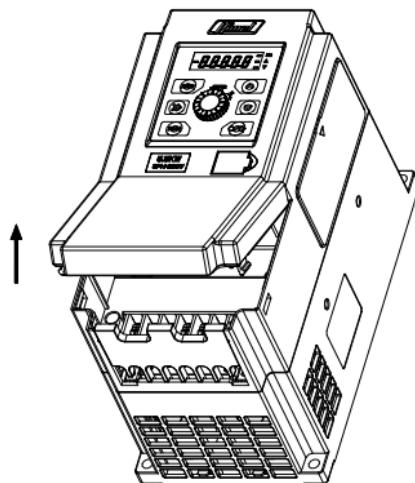

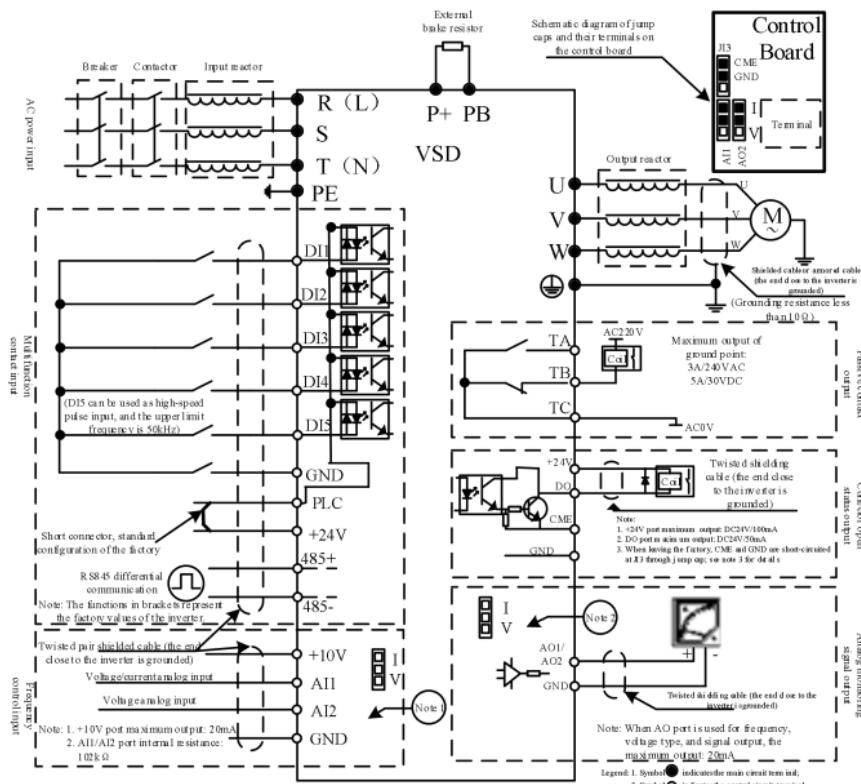

Figure 2-7 Wiring Flip Shell's Open-Control Terminal Wiring

## 2.3 Standard wiring diagram

Note 1: The AI1 port can receive both voltage signals and current signals; AI1 (three-PIN needle on corresponding control board, the bottom left one is for AI1) in the corresponding wiring diagram (as shown in the upper right corner of the above figure); short the middle and the upper pin for current signal input; short the middle and bottom pin for voltage signal input; the AI2 port can only receive voltage signals.

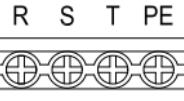

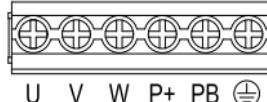

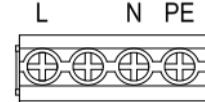

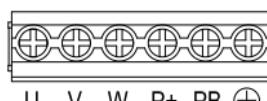

Note 2: The AO2 port can output both voltage signals and current signals; AO2 (three-PIN needle on corresponding control board, the bottom right one is for AO2) in the corresponding wiring diagram (as shown in the upper right corner of the above figure); short the middle and the upper pin for current signal input; short the middle and bottom pin for voltage signal input; the AO1 port can only output voltage signals.

Note 3: The standard factory configuration of CME and GND is that the middle pin of JI3 is short-circuited to its upper pin (under standard factory configuration, DO port uses the internal +24V as the pull-up power supply, and its ground system is drive GND), that is, CME is short circuited to GND; when GND interfaces are insufficient, the CME interfaces can be used as GND interfaces;

When DO port uses the external +24V power supply as pull-up (DO port is pulled up to +24V through 4.7K resistance), just remove the jump cap of JI3 port (just place the short-circuited cap to the JI3 middle pin and the lower pin, to avoid loosing jump cap), in this case, CME is short-circuited to the ground system of external +24V power supply.

### 2.3.1 Wiring of main circuit terminals

(1)The main circuit input and output terminals are shown in Table 2-2.

Applicable models	Main circuit terminals	Terminal name	Function description
HAV-BA/SS-4T0004G HAV-BA/SS-4T0007G HAV-BA/SS-4T0015G HAV-BA/SS-4T0022G	 R S T PE U V W P+ PB $\ominus$	R, S, T	Three-phase AC 380V input terminal
		PE	Protective ground terminal
	 U V W P+ PB $\ominus$	U, V, W	Three-phase AC output terminal
		P+, PB	Braking resistor wiring terminal
		$\ominus$	Motor ground terminal
HAV-BA/SS-2S0004G HAV-BA/SS-2S0007G HAV-BA/SS-2S0015G	 L N PE U V W P+ PB $\ominus$	L, N	Single-phase AC input terminal
		PE	Protective ground terminal
	 U V W P+ PB $\ominus$	U, V, W	Three-phase AC output terminal
		P+, PB	Braking resistor wiring terminal
		$\ominus$	Motor ground terminal

## Chapter II Installation and Wiring of Drive

Applicable models	Main circuit terminals	Terminal name	Function description
HAV-BA/SS-4T0040G HAV-BA/SS-4T0055G HAV-BA/SS-2T0022G		R, S, T	Three-phase AC 380V input terminal
		U, V, W	Three-phase AC output terminal
		P+, PB	Braking resistor wiring terminal
		PE	Protective ground terminal
		( $\ominus$ )	Motor ground terminal
HAV-BA/SS-2S0022G		L, N	Single-phase AC input terminal
		U, V, W	Three-phase AC output terminal
		P+, PB	Braking resistor wiring terminal
		PE	Protective ground terminal
		( $\ominus$ )	Motor ground terminal

(2) The selection of main circuit cable diameter and protection circuit breaker QF or fuse at VSD input in show in Table 2-3:

Specification	Circuit breaker (A)	Fuse (A)	Recommended input and output power wires(mm <sup>2</sup> )	Control wire (mm <sup>2</sup> )
HAV-BA/SS-4T0004G	10	10	1.5	1
HAV-BA/SS-2S0004G	10	10	1.5	1
HAV-BA/SS-4T0007G	10	10	1.5	1
HAV-BA/SS-2S0007G	10	10	1.5	1
HAV-BA/SS-4T0015G	10	10	1.5	1
HAV-BA/SS-2S0015G	20	16	2.5	1
HAV-BA/SS-4T0022G	16	10	2.5	1
HAV-BA/SS-4T0040G	20	16	2.5	1
HAV-BA/SS-4T0055G	25	25	4.0	1

## 2.4 Control circuit configuration and wiring

### 2.4.1 Control circuit terminal arrangement is as follows

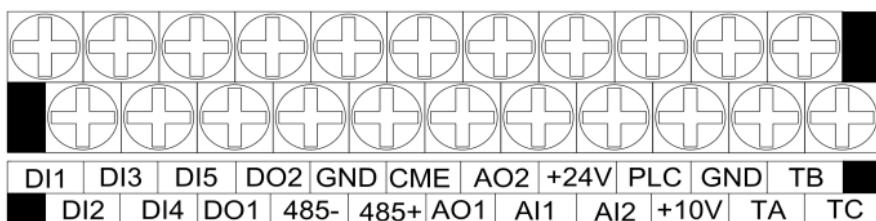

Figure 2-8 Arrangement Sequence of Control Plate Terminals

## 2.4.2 Control terminal function description is shown in Table 2-4.

Table 2-4 Control Terminal Function Table

Category	Terminal Label	Name	Terminal function description	Specification
Communication	485+	RS485 communication interface	RS485 differential signal positive terminal	For standard RS485 communication interface, please use twisted pair or shielded wire.
	485-		RS485 differential signal negative terminal	
Multifunctional output terminal	DO1	Open collector output terminal	It can be programmed and defined as switch output terminal with multiple functions, see terminal function parameter F6.11 for details/output terminal function introduction (common port CME)	Optocoupler isolated output; Working voltage range 9-30V; Maximum output current: 50mA
Multifunctional output terminal	DO2	Open collector output terminal	It can be programmed and defined as switch output terminal with multiple functions, see terminal function parameter F6.12 for details/output terminal function introduction (common port CME)	Optocoupler isolated output; Working voltage range 9-30V; Maximum output current: 50mA; Maximum output frequency: 50kHz;

Analog Input	AI1	Analog input AI1	AI1 terminal receiving analog current, and voltage input (selected and switched through jump cap)	Input voltage range: 0~10V (input impedance: 102kΩ) Resolution: 1/1000  Input current range: 0~20mA (input impedance: 255Ω) Resolution: 1/1000
	AI2	Analog input AI2	Receives analog voltage input	
Analog output	AO1	Analog output	Provides analog voltage output, which can correspond to 12 physical quantities (see F5.25 for details)	Voltage output range: 0~10V
	AO2	Analog output	Provides analog voltage output, and current output (AO2 terminal can be realized by jump cap) can correspond to 12 physical quantities (see F5.26 for details)	Voltage output range: 0~10V Current output range: 0~20mA
Multifunctional input terminal	DI1	Multifunctional input terminal 1	It can be programmed and defined as switch input terminal with multiple functions, see Chapter VI for terminal function parameters (switch input and output) input terminal function introduction. (See F6.00-6.04 for details)	The forward and reverse functions can be configured for the terminal; DI5 can be used as a high-speed pulse input terminal, and the upper limit of the input frequency is 50kHz;
	DI2	Multifunctional input terminal 2		
	DI3	Multifunctional input terminal 3		

	DI4	Multifunctional input terminal 4		
	DI5	Multifunctional input terminal 5		
Power supply	+10V power supply	+10V power supply	Provides +10V power supply for external use	Maximum output current: 20mA
	+24V power supply	+24V power supply	Digital signal power supply	Maximum output current: 100mA
	GND	Power supply common port	Power reference ground (including +10V and +24V)	It is the only ground system on the control board.
	PLC	Multifunctional input common port	Common port of DI1-DI5	Short-circuited to +24V as factory default.
	CME	Digital output common port	Common port of multifunctional DO1 and DO2.	Short-circuited to GND as factory default.
Relay output terminal	TA TB TC	Programmable relay output	Usually, TA-TB is normally open, and TA-TC is normally close; during operating, TA-TB is normally close, and TA-TC is normally open.	NO: 5A 250VAC NC: 3A 250VAC

### 2.4.3 Wiring of communication terminal

PLC or PC is used for master control, with the drive as the slave, which are connected through RS485. It can realize single master and single slave communication or single master and multiple slaves communication. With the increasing connection units, the communication system becomes more susceptible to the interference, so it is suggested to connect wires as follows (see Annex for communication protocol):

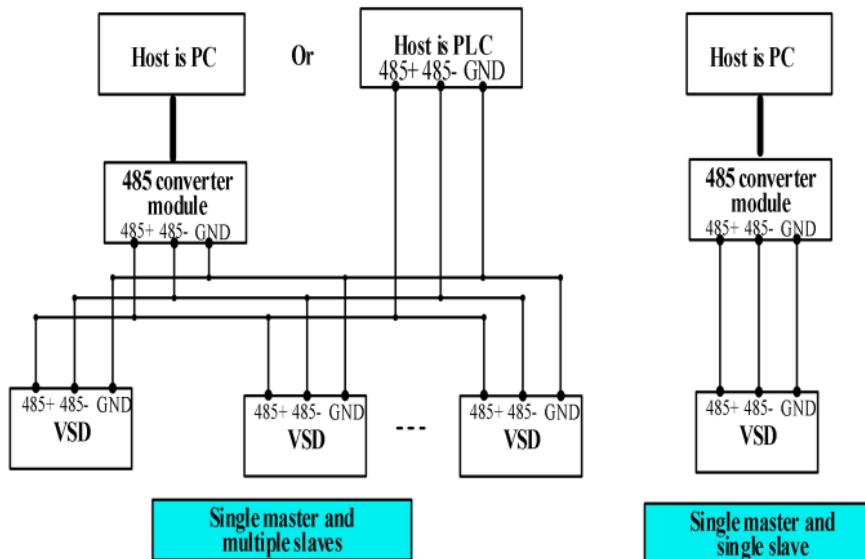

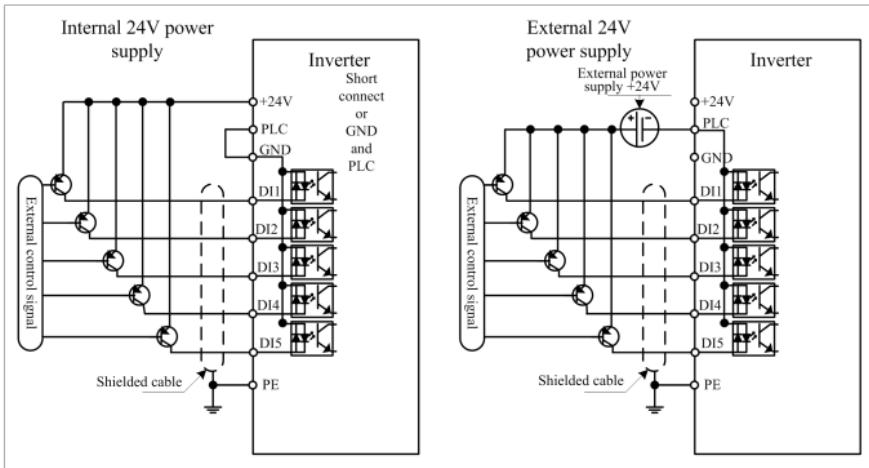

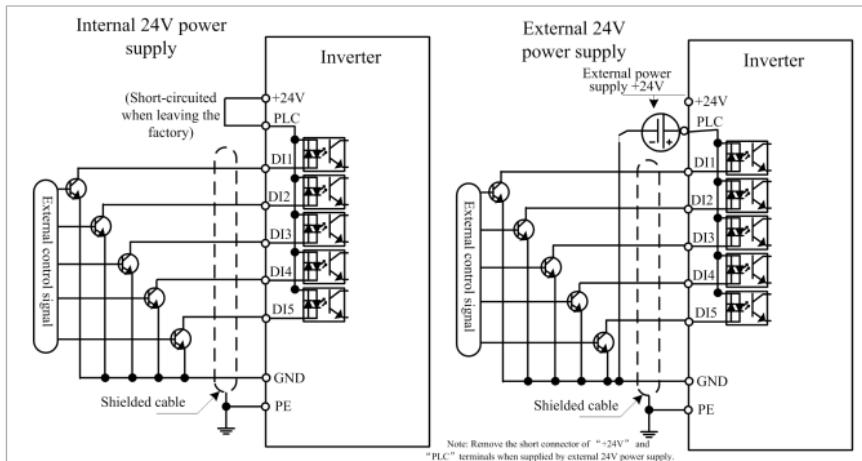

Figure 2-9 Wiring of Communication Terminal

## 2.4.4 Multifunctional contact input wiring

### (1) Wiring method of PNP characteristic transistor

### (2) Wiring method of NPN characteristic transistor

# Chapter III Operation Instructions of Drive

## 3.1 Key function description

The drive operation panel is provided with 7 keys and 1 rotary encoder. The functions are defined in Table 3-1.

Table 3-1 Operation Panel Function Table

Key	Name	Label in the manual	Function description
	Program/Exitkey		Enter or exit programming state
	Run key		In the operation mode, press this key to run the drive.
	Stop key		When the drive is in the normal running state and the drive's running instruction channel is set to the keypad, press this key to stop drive according to the set mode. When the drive is in the fault state, press this key to reset the drive and return to the normal stop state.
	Increase key		Increase data or function code
	Decrease key		Decrease data or function code
	Shift key		In the edit state, you can select the modification bit of the set data
	Rotary encoder		When pressed down, it is the  key, you can enter the drop-down menu or data confirmation.
			When the frequency channel is given by the keypad, the rotary encoder can modify the set

			frequency of the drive.
--	--	--	-------------------------

## 3.2 Keypad operation methods

You can perform various operations on the drive by keypad, as follows:

### 3.2.1 Shortcut monitoring parameter view

6 shortcut parameters are fixed to be displayed in the shortcut monitoring interface which can be switched by the Up or Down key. When the ENT key is pressed down in this interface, it will immediately return to the first shortcut parameter. 6 shortcut parameter sequence list is in the below table:

Shortcut parameter 1	Determined by function code FC.17
Shortcut parameter 2	Output current
Shortcut parameter 3	Bus voltage
Shortcut parameter 4	Set frequency
Shortcut parameter 5	AI1
Shortcut parameter 6	Terminal state 1

The above table shows shortcuts in the general mode, which will vary with different industry code for different industries.

### 3.2.2 Settings of function code parameters

The function parameter system of this drive includes function code F0 ~ FF group, monitoring parameter U0 group, and fault record parameter U1 group. Each function group includes several function codes. The function code is identified by (function code group number + function code number). For example, “F5.08” indicates the 8th function code of the 5th function group.

Function code setting example:

Example 1: Change the forward jog frequency setting from 5Hz to 10Hz (Change F2.20 from 5.00Hz to 10.00Hz)

- 1) Press the **PRG** key to enter the programming state, the digital display will show function parameter “-F0-” and press the **▲** key to make the LED display to show “-F2-”.
- 2) Press **ENT**, you will see the digital display shows function parameter “F2.00”.
- 3) Press the **▲** key to change the digital display to display function parameter “F2.20”.
- 4) Press the **ENT** key, you will see the value (5.00) corresponding to F2.20, meanwhile, the LED labeled “Hz” lights up.
- 5) Press the **▶▶** key and shift to the highest bit “5”, and press the **▲** key five times, to change to **10.00**.
- 6) Press the **ENT** key. If the parameter does not flash, it indicates the modification is successful.
- 7) Press the **PRG** key to exit the programming state.

**Note: In P.off state, it is forbidden to modify the function code parameter.**

### 3.2.3 Jog function operation

Use the keypad to perform the jog operation of the drive:

- 1) Press the **PRG** key three times to enter the jog operation state, and the digital tube displays function parameter “**JOG-**”.

- 2) Press and hold the Up key to forward jog.
- 3) Press and hold the Down key to reverse jog.

### 3.2.4 Parameter upload and download operations

The external keypad has the functionality of uploading and downloading the function code.

1) On the external keypad, press the key + the key, to execute the function code uploading function. The external keypad reads all the function code values from the control board, and then writes into the keypad memory chip.

2) On the external keypad, press the key + the key, to execute the function code downloading function. The external keypad reads all the function code values from the memory chip, and then writes into the drive control board chip. However, when downloading, the keypad will automatically distinguish the software version, drive voltage level, and drive power level. The specific conditions are as follows:

a. If the downloaded function code is inconsistent with the drive software version of the parameter to be downloaded, it will not be downloaded and an E028 fault will be reported.

b. If the downloaded function code is inconsistent with the drive voltage level of the parameter to be downloaded (e.g. The downloaded function code is of 2S model, but the drive is of 4T model), it will not be downloaded and an E028 fault will be reported.

c. If the downloaded function code is consistent with the drive voltage level of the parameter to be downloaded but the power level is inconsistent, only F3 group motor related parameters will not be downloaded, and all the other parameters will be downloaded normally.

d. If the downloaded function code is consistent with the drive software version, voltage level, and power level of the parameter to be downloaded, all parameters will be downloaded.

Remarks:

1. The machine's standard external keypad is a short-line keypad (the length of the keypad line is 15m or less). The keypad does not support online update software;

2. The long-line keypad (the length of the keypad line is 80m or less) is an optional accessory. The long-line keypad with LCD screen supports online software update. If the customer needs a long-line keypad, special instructions are needed for special treatment of the whole machine.

# Chapter IV Function Parameter Table

## 4.1 Function parameter table

Description of symbols in the table:

- × - Indicates this parameter cannot be changed during the operation.
- - Indicates this parameter can be changed during the operation.
- - Indicates the actual test parameter, which cannot be changed.
- \* - Indicates this parameter is the reserved parameter by the manufacturer, which is prohibited to be changed.

Parameter Code	Parameter name	Parameter detailed description	Minimum Unit	Factory value	Change
<b>F0 group: system management parameter</b>					
F0.00	Parameter operation protection	0: Password operation. You can view the function code value without entering a password, but you cannot change it. You need to enter the correct password in F0.05 before changing the function code. 1: Password operation. You cannot view the function code value when no password is entered, and the function code will display “----”. You need to enter the correct password in F0.05 before viewing and changing the	1	0	○

FC.28	KI2		1	1000	
FC.29	PI Switching point	If the absolute value of bus voltage minus the reference value is bigger than this value, it will switch to KP2、KI2; otherwise it is KP1、KI1	1v	30v	
FC.30	PI search interval	The shorter the time is, the faster the tracking is, but also the faster the solar voltage fluctuations	0.1s	2.0s	

**Fd group: Virtual terminal parameter function**

Fd.00	VDI1 terminal function selection	Same as F6.00~F6.08 function code setting. Note: The VDI virtual terminal is an extension of the physical input terminal. The communication sends instructions to simulate the actual terminal. Each bit in the communication data represents a terminal, and the value of each bit	1	0	x
Fd.01	VDI2 terminal function selection		1	0	x
Fd.02	VDI3 terminal function selection		1	0	x

## Chapter IV Function Parameter Table

---

Parameter Code	Parameter name	Parameter detailed description	Minimum Unit	Factory value	Change
Fd.03	VDI4 terminal function selection	represents the status of the corresponding terminal. For specific bit definition, please refer to the communication address 0x1206 description.	1	0	x
Fd.04	VDI5 terminal function selection	<b>The function of each terminal cannot be the same. If the functions of the two terminals are set to the same, the physical terminal will act prior to the virtual terminal in order. In this case, the DI ports ranked first will work and the latter ones will not work.</b>	1	0	x
Fd.05	VDI6 terminal function selection		1	0	x
Fd.06	VDI7 terminal function selection		1	0	x
Fd.07	VDI8 terminal function selection		1	0	x
Fd.08	VDI9 terminal function selection		1	0	x
Fd.09	VDI10 terminal function selection		1	0	x
Fd.10	VDO1 terminal function selection	Same as F6.11~F6.13 function code setting. Note: The VDO virtual terminal is an extension	1	0	x

Parameter Code	Parameter name	Parameter detailed description	Minimum Unit	Factory value	Change
Fd.11	VDO2 terminal function selection	of the physical output terminal. The virtual terminal status can be read only through communication. Each bit in the communication data represents a terminal, and the value of each bit represents the status of the corresponding terminal. For specific bit definition, please refer to the communication address 0x1207 description.	1	0	×
Fd.12	VDO3 terminal function selection		1	0	×
Fd.13	VDO4 terminal function selection		1	0	×
Fd.14	VDO5 terminal function selection		1	0	×
Fd.15	VDO1 output on delay	Same as F6.29~F6.34 function code setting.	0.1s	0.0s	○
Fd.16	VDO2 output on delay		0.1s	0.0s	○
Fd.17	VDO3 output on delay		0.1s	0.0s	○
Fd.18	VDO4 output on delay		0.1s	0.0s	○
Fd.19	VDO5 output on delay		0.1s	0.0s	○

## 4.2 Monitoring parameter group U0

Parameter Code	Parameter name	Parameter detailed description
U0.00	Output frequency	Displays the output frequency of the current drive
U0.01	Set frequency	Displays the set frequency of the current drive
U0.02	Output current	Displays the output current of the current drive
U0.03	Bus voltage	Displays the bus voltage of the current drive
U0.04	Running speed	Displays the running speed of the current drive <b>Note: Speed = 120*frequency*speed</b>

Parameter Code	Parameter name	Parameter detailed description
		<b>display factor (FC.18)/number of motor poles (F3.11)</b>
U0.05	Linear running speed	Displays the linear running speed of the current drive <b>Note: Linear speed = speed*linear speed display factor (FC.19)</b>
U0.06	Output power	Displays the output power of the current drive
U0.07	Output torque	Displays the output torque of the current drive
U0.08	Output voltage	Displays the output voltage of the current drive
U0.09	AI1	Displays the actual input voltage/current of AI1 of the current drive (when the input is of current type, 1mA current corresponds to 0.5V voltage display)
U0.10	AI2	Displays the actual input voltage of AI2 of the current drive
U0.11	PID setting	Displays the PID target value of the current drive
U0.12	PID feedback	Displays the PID feedback value of the current drive
U0.13	Counter value	Displays the counter value of the current drive
U0.14	Closed-loop pressure display	Displays the closed-loop pressure value of the current drive <b>Note: Closed-loop pressure = PID feedback value*pressure sensor range (F8.23)</b>
U0.15	Actual length	Displays the actual length accumulated by the fixed length control function of the current drive
U0.16	High-frequency pulse count	Displays the accumulated pulse count value of the DI5 high-speed input signal of the current

## Chapter IV Function Parameter Table

<b>Parameter Code</b>	<b>Parameter name</b>	<b>Parameter detailed description</b>
	value	drive (not saved after power failure)
U0.17	Pulse frequency display	Displays the pulse frequency of the DI5 high-speed input signal of the current drive
U0.18	Drive rated power	Displays the rated power of the drive
U0.19	Drive rated voltage	Displays the rated voltage of the drive
U0.20	Drive rated current	Displays the rated current of the drive
U0.21	Reserved	-
U0.22	IGBT temperature	Displays the IGBT temperature of the current drive
U0.23	DI terminal status 1	<p>Displays current input terminal function status (defined by bit, 0 indicates that the current terminal input function is invalid, and 1 indicates that the current terminal input function is valid):</p> <p>LED single digit: DI1 input status            LED tens digit: DI2 input status            LED hundreds digit: DI3 input status            LED thousands digit: DI4 input status            LED ten thousands digit: DI5 input status</p>
U0.24	Reserved	-

Parameter Code	Parameter name	Parameter detailed description
U0.25	DO terminal status	<p>Displays current output terminal function status (defined by bit, 0 indicates that the current terminal output function is invalid, and 1 indicates that the current terminal output function is valid):</p> <p>LED single digit: DO1 output status</p> <p>LED tens digit: DO2 output status</p> <p>LED hundreds digit: Relay output status</p> <p>LED thousands digit: Reserved</p> <p>LED 10 thousands digit: Reserved</p>
U0.26	Reserved	-
U0.27	Running time accumulation	Displays the accumulated running time of the current drive
U0.28	Software version number	Displays the software version of the current drive
U0.29	Operating state of solar pump	<p>0 :Normal          1 :Empty water state          2 :Full water state          3 :Weak light state</p>

**4.3 Fault record parameter group U1**

Parameter Code	Parameter name	Parameter detailed description	Factory value	Change
U1.00	Historical fault number	Set range: 0~9 According to the setting of this function code, you can view the fault record information of the last 10 times. By setting different values within U1.01~U1.06, the corresponding fault record will display.	0	○
U1.01	Fault code during fault	Fault record information at the xth fault (x is the set value of U1.00)	-	●
U1.02	Bus voltage during fault		-	●
U1.03	Output current during fault		-	●
U1.04	Running frequency during fault		-	●
U1.05	Running temperature during fault		-	●
U1.06	Fault occurrence time		-	●

## 4.4 Fault code table

Fault code	Fault type	Fault code	Fault type
E001	overcurrent during acceleration	E016	485 communication error alarm
E002	overcurrent during deceleration	E017	Current detection circuit fault alarm
E003	overcurrent during constant-speed running	E018	Reserved
E004	overvoltage during acceleration	E019	Reserved
E005	overvoltage during deceleration	E020	Closed-loop feedback loss alarm
E006	overvoltage during constant-speed running	E021	Water pressure overpressure alarm
E007	Undervoltage alarm during running	E022	Reserved
E008	Motor overload alarm	E023	Water shortage alarm
E009	Drive overload alarm	E024	Reserved
E010	Reserved	E025	Underload alarm
E011	Reserved	E026	Hydraulic probe damage of empty water
E012	Output phase loss alarm	E027	Hydraulic probe damage of full water
E013	Drive module radiator overheat alarm	E028	Keypad parameter copy error alarm
E014	Rectifier module radiator overheat alarm	E029	Reserved
E015	External fault alarm	E099	Reserved

# Appendix I Communication Protocol

Networking mode

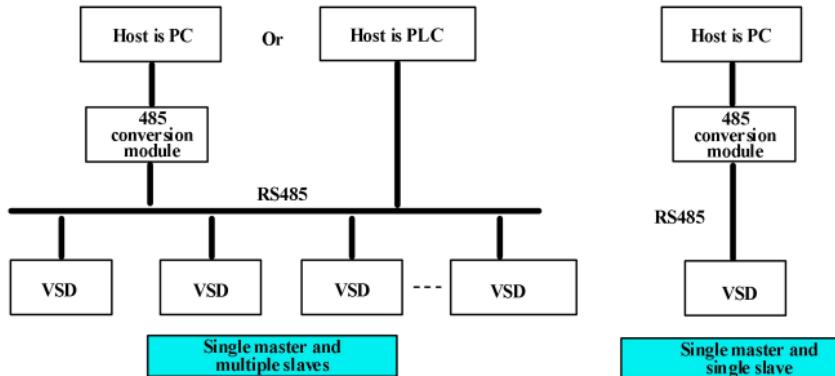

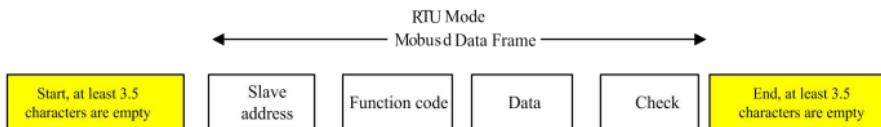

Figure 1 Schematic Diagram of Drive Networking Mode

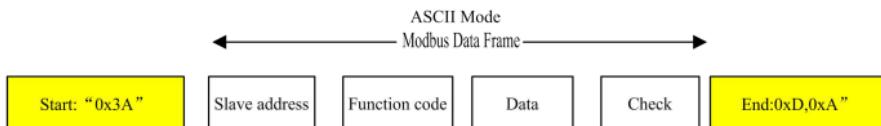

## Interface mode

RS485: asynchronous, half-duplex. Default: 8-N-2, 9600BPS.  
For parameter setting, please refer to group Fb description.

## Protocol format

The Modbus protocol supports both RTU mode and ASCII mode. The corresponding frame format is as follows:

## Protocol function:

The main function of Modbus is to read and write parameters. Different function codes determine different operation requests. The drive Modbus protocol supports the following function code operations:

Function code	Function code description
0x03	Read drive function code parameter and running status parameter
0x06	Rewrite function code or control parameter of single drive
0x10	Rewrite function code or control parameter of multiple drives

The function code parameter, control parameter and status parameter of the drive are mapped as Modbus read-write registers. The read-write characteristics and range of the function code parameters follow the instructions in the drive user manual. The group number of the drive function code is mapped to the high byte address of the register, and the index in the group is mapped to the low byte address of the register. The control parameter of the drive is virtualized to the drive function code group 18, and the status parameter of the drive is virtualized to the drive function code group 19. The correspondence between the function code group number and the high byte of its mapped register address is as follows:

Group F0: 0x00; group F1: 0x01; group F2: 0x02; group F3: 0x03; group F4: 0x04; group F5: 0x05; group F6: 0x06; group F7: 0x07; group F8: 0x08; group F9: 0x09; FA group: 0x0A; Fb group: 0x0B; FC group: 0x0C; Fd group: 0x0D; FE group: 0x0E; FF group: 0x0F; U0 group: 0x10; U1 group: 0x11; drive control parameter group: 0x12; drive status parameter group: 0x13.

For example, the register address of the drive function code parameter F3.02 is 0x0302, and the register address of the drive function code parameter FE.01 is 0x0E01.

If the operation request fails, the response is an error code and an exception code. The error code is equal to (function code + 0x80), and the exception code indicates the error reason. The exception codes are listed as follows:

Exception code	Exception code Description
0x1	Illegal function code.
0x2	Illegal register address.
0x3	Data error, that is, the data exceeds the upper or lower limit.
0x4	Slave operation failed (including errors caused by invalid data, although the data is within the upper and lower limits).
0x18	Information frame error: Including information length error and check error.
0x20	Parameters cannot be modified.
0x21	Out of the range of function group.

The drive control parameters can complete functions to start, stop, and set running frequency of the drive. By searching drive status parameters, parameters such as operating frequency, output current, and output torque of the drive can be obtained. The specific drive control parameters and status parameters are enumerated as follows (except 0x1207 virtual output terminal is read-only, other parameters are both readable and writable):

## Basic drive control parameter index

Register address	Parameter name	Whether kept saved after power failure
0x1200	Control command word 1	No
0x1201	Main frequency setting	Yes
0x1202	Reserved	-
0x1203	PID target value	Yes
0x1204	PID feedback value	Yes
0x1205	Analog output AO, high-speed DO2 setting	No
0x1206	Virtual input terminal: Defined by bit: BIT0~9 = VDI1~VDI10, BIT10~15 = Reserved	No
0x1207	Virtual output terminals (read-only): Defined by bit: BIT0~4 = VDO1~VDO5, BIT5~15 = Reserved	No
0x2000	Control command word 2	No
0x2001	Main frequency setting	Yes

## Basic drive status parameter index

Register address	Parameter name
0x1300	Running status word
0x1301	Drive model

The drive control command word 1 (register address 0x1200) bit is defined as follows:

Control word (bit)	Value	Significance	Function description
Bit2, 1, 0	111B	Run command	Start the drive
	110B	Stop command	Stop according to the way set by function code F2.08
	Remaining	No command	
Bit3	1	Reverse	Set the running direction when the run command is valid (invalid for jog command)
	0	Forward	
Bit8~Bit4	0	Reserved	-
Bit9	1	Fault reset valid	
	0	Fault reset invalid	
Bit15~Bit10	0	Reserved	-

The drive control word 2 (register address 0x2000) bit is defined as follows:

Control word (bit)	Value	Significance	Function description
Bit1, 0	00B	No function	
	01B	Stop	Stop according to the way set by function code F2.08
	10B	Start	Start the drive
	11B	No function	
Bit3, 2	0	Reserved	-
Bit5, 4	00B	No function	
	01B	Forward instruction	
	10B	Reverse	
	11B	Fault reset	
Bit15~Bit5	0	Reserved	-

The drive status word (register address 0x1300) bit is defined as follows:

Status word (bit)	Value	Description	Remarks
Bit0	1	Drive running	
	0	Drive stop	
Bit1	1	Drive reverse	
	0	Drive forward	
Bit2	1	Reached the main setting	
	0	Not reached the main setting	
Bit7~Bit3	0	Reserved	
Bit15~Bit8	00~0xFF	Fault code	0: Indicates the drive is normal; Not 0: Indicates fault. Refer to the user manual of the drive of relevant type for detailed fault code significance. For example, the fault code for motor overload E008 is 0x08, and for undervoltage is 0x1F.

## Application example

The command to start the 1# drive in the forward direction and set the speed to 50.00HZ (internally indicated as 0x1388) is as follows:

	Address	Function code	Register address	Register number	Register content bytes	Register content	Verification code
Request	0x01	0x10	0x1200	0x0002	0x04	0x000 7, 0x138 8	0x9B9 8
Response	0x01	0x10	0x1200	0x0002	None	None	0x44B 0

5# drive fault reset:

Address	Function code	Register address	Register content	Verification code
0x05	0x06	0x1200	0x0200	0x8C56
0x05	0x06	0x1200	0x0200	0x8C56

Read the running frequency of the 4# drive, and the drive response running frequency is 50.00HZ:

Address	Function code	Register address	Register number or read bytes	Register content	Verification code
0x04	0x03	0x1000	0x0001	None	0x809F
0x04	0x03	None	0x02	0x1388	0x7912

Write the acceleration time 1 (i.e. function code F1.11) of 5# drive to 1.00s, and do not save after power failure.

Address	Function code	Register address	Register content	Verification code
0x05	0x06	0x010B	0x0064	0xF99B
0x05	0x06	0x010B	0x0064	0XF99B

Read the output current of 5# drive, and the drive response output current is 3.00A.

Address	Function code	Register address	Register number or read bytes	Register content	Verification code
0x05	0x03	0x1002	0x0001	None	0x208E
0x05	0x03	None	0x02	0x012C	0x49C9

### **Calibration relationship of the drive**

A) The calibration of the frequency is 1:100

To make the drive run at 50Hz, the main setting shall be 0x1388 (5000).

B) The calibration of the time is 1:100

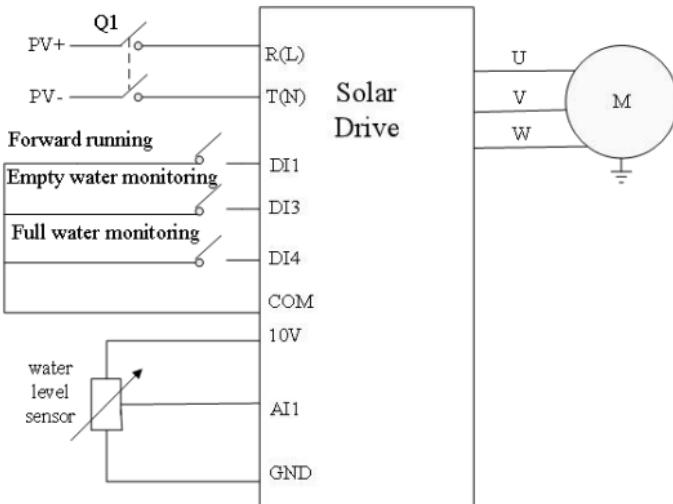

To make the drive acceleration time be 3s, the function code setting shall be 0x012C (300).

C) The calibration of the current is 1:100

If the drive feedback current is 0x012C (300), the current of the drive is 3A.

## Appendix II Solar Pump Drive Instruction

Solar pump drive wiring diagram

### NOTE:

1)The AC power of the grid and the DC power of the PV can not be supplied to the drive at the same time,only one power supply can be chosen

2)The DC breaker Q1 must be installed as the protection switch for PV input

3)When the distance between the PV input component and inverter exceeds 10 meters, type-II surge protection devices must be configured at the DC side

When the distance between the pump and inverter exceeds 50 meters, it is recommended to configure output reactors.

## Product Specifications

Drive Model	2S	4T
Input voltage(AC)	220V-250v	380V-440V
Input voltage(DC)	150V-400V	250v-800V
Maximum DC voltage	400V	800V
Recommended DC input voltage range	250V-372V	460V-680V
Recommended MPP voltage	330V	550V

## Selection of solar panels

Solar panel voltage Motor voltage	Solar panel connection mode 18V(vpm)	Solar panel connection mode 30V(vpm)
220V	18-20 pcs (connection in series then in parallel)	10-12pcs (connection in series then in parallel)
380V	30-33pcs (connection in series then in parallel)	18-20pcs (connection in series then in parallel)

According to the requirements of required power, each group of solar panels will be used together in parallel

The power of the solar panels is recommended to be 1.3-2.0 times of the rated power of 380v pumps or 1.6-2.0 times of 220v pumps

## Warranty Agreement

1. The warranty covers only the drive itself.
2. During normal use, if the drive fails or is damaged within 18 months, the company shall be responsible for repairing; After 18 months, a reasonable maintenance fee will be charged.
3. The start of the warranty period is the date of manufacture of our company.
4. Within 18 months, a certain maintenance fee shall also be charged if:
  - Unable to follow the operation steps in the user manual causing damages to the drive.
  - The drive is damaged due to flood, fire, abnormal voltage, etc.
  - The drive is damaged due to incorrect wiring, etc.
  - Damages caused by using the drive for abnormal functions.
5. The related service fee is calculated based on actual cost. If there is a contract, the contract shall prevail during treatment.
6. Please keep this card and show it to the repair unit during warranty.

If there are any questions, you can contact the supplier directly or contact our company.
